Lab Assignment 5

CS 362 – Principles of Programming Languages II

Winter 2018

Riddle

The excursion to the jungle you did for your biology class did not go as planned. You find yourself on the run in the middle of the night from some scary creatures which you where unable to clearly see, but they certainly looked very hungry and scary. Together with you are Adam, Brianna, and Charlotte.

You reached an old shaky bridge you have to cross to get to safety. The bridge can only be crossed by at most two people at once. Additionally, since it is night, you need a light to cross the bridge, but you only have one working light left. Thus, whenever somebody crossed the bridge, somebody has to run back with the light to enable the next to cross it. Each time two people are crossing the bridge, they are as fast as the slowest person.

Adam is athlete and can cross the bridge in 1 minute. Brianna, thanks to her major in nutrition, is also in good shape and can cross the bridge in 2 minutes. You as a computer science major spend your days sitting at your computer eating pizza and, therefore, need 5 minutes to cross the bridge. Charlotte, the biology grad student who is guiding you, was convinced that the big spider she showed you earlier is totally harmless. As a result, her leg is swollen and crossing the bridge takes her 10 minutes.

What is the fastest way to get everybody on the other side of the bridge?

Assignment

Implement a Prolog program that allows you to determine the fastest way to cross the bridge. Your implementation should be similar to the riddle discussed in class. You should have a predicate `move(C1, S, C2)` stating that configuration `C1` leads to configuration `C2` if the students in `S` cross the bridge. (You can use atoms or list of atoms for the different options of `S`.) You should also have a predicate `solution(C, L, T)` stating that applying the list of moves `L` to the configuration `C` leads to a solution (everybody crossed the bridge) in `T` time (in minutes).

Submission

Write your implementation in a single `.pl`-file and upload it to canvas.
This is an individual assignment. Therefore, a submission is required from each student.

Deadline: Sunday, February 18, 11:59 pm.
